

Revisions to the Canadian Emergency Department Triage and Acuity Scale (CTAS) Guidelines 2016

Michael J. Bullard, MD*^{*}; Erin Musgrave, MN, RN[†]; David Warren, MD[‡]; Bernard Unger, MD[§]; Thora Skeldon, RN, BSN[¶]; Rob Grierson, MD^{||}; Etienne van der Linde, MD^{**††}; Janel Swain, ACP, BSc, BEd^{‡‡}; on behalf of the CTAS National Working Group

INTRODUCTION

The Canadian Triage and Acuity Scale (CTAS) was introduced in 1999¹ after studying the successful National Triage Scale (NTS) from Australia.² The Canadian Association of Emergency Physicians (CAEP), National Emergency Nurses Association (NENA), l'Association des médecins d'urgence du Québec (AMUQ), and the Society of Rural Physicians of Canada (SRPC) formed the CTAS National Working Group to promote its use in Canada. Recognizing that children from neonate to adolescent were not adequately differentiated based on an adult centric triage tool the Canadian Paediatric Society (CPS) approached the CTAS NWG and in collaboration published the Canadian Paediatric Triage and Acuity Scale in 2001.³ In 2003 the Canadian Emergency Department Information System (CEDIS) National Working Group published a standardized national ED presenting complaint list which offered an inviting framework for CTAS to build on.⁴ In 2004 adult CTAS was reformulated, using the 17 CEDIS complaint groups and the 165 complaints, primary or 1st order modifiers were defined based on vital signs, pain, and mechanism of injury, to help nurses assign an appropriate triage score.⁵ To further refine the appropriate prioritization, special or 2nd order modifiers were identified for certain complaints or groups of complaints where the 1st order modifiers were inadequate. Mental health complaints have primarily 2nd order modifiers as acuity and risk for these patients are rarely

adequately defined by vital signs or pain. For patients with “chest pain, non cardiac features”, ‘ripping, tearing’ pain is a CTAS level 2 modifier to try to avoid missing an aortic dissection.

In 2008 there was a collective review of and update of the CEDIS complaint list, Adult CTAS and Paediatric CTAS to align them in terms of timing and of structural congruence by adding paediatric definitions and 2nd order modifiers, and a few paediatric specific CEDIS complaints.⁶⁻⁸ As noted previously the structure for CTAS based on a standardized presenting complaint list and defined modifiers to assign triage acuity began in 2004, and all subsequent publications build on this document. It was also decided that updates would be undertaken every 4 years. The 2012 update was relatively minor and was e-published in 2013.⁹ The 2016 review and revisions has been extensive and while it will not lead to major changes in CTAS itself, a great deal of energy has gone into improving the educational materials and processes which will be outlined within the document.

RATIONALE FOR CHANGE

The CTAS NWG receives and responds to questions and suggestions from CTAS instructors, emergency nurses, administrators, our international partners, and patients on a regular basis. We respond to requests received through the CTAS NWG members on behalf of their organizations: CAEP, NENA, AMUQ, SRPC, CPS, and most recently the Paramedic Chiefs of

Canada (PCC). Requests are also received through the Canadian Institute for Health Information (CIHI) who co-manages the CEDIS Complaint list with the CTAS NWG. More recently the Society of Obstetricians and Gynaecologists of Canada have collaborated on the development of the Obstetrical Triage Acuity Scale (OTAS) that has provided another opportunity for CTAS advancement and alignment.¹⁰ To prepare for this update CTAS NWG Instructors, nationally, were surveyed for their suggestions which were then organized and brought back to the committee for review and consideration.

This update focuses on the following key areas:

1. Review and clarity regarding triage acuity time targets
2. Addressing the practice of using CTAS as a tool to divert patients away from the ED
3. Presenting CEDIS complaint additions and modifications
4. Introduction of 'heat related issue' along with special modifiers
5. Revised pregnancy modifiers accompanied by the introduction 'post-partum issues' and special modifiers
6. Introduction of a new frailty modifier
7. Development and presentation of a new geriatric educational component recognizing the challenges associated with our fastest growing demographic
8. Paediatric updates focusing on fever standards and recognizing hypertension in children
9. Welcoming the Paramedic Chiefs of Canada as the newest member organization of the CTAS NWG and updating the plans for Prehospital CTAS (Pre-CTAS)
10. Introducing planned changes in the education process, teaching materials and CTAS certification

METHODS

The revisions have been at iterative process based on feedback from our key stakeholders, the CTAS Instructors and Providers, the general public, the CTAS NWG member organizations, the Canadian Institute of Health Information through their National Ambulatory Care Reporting System (NACRS) representatives and health administrators. Increasing demand for health care services within a constrained economy

has led to requests from administrators and providers to alter the recommended CTAS time targets based on acuity, pointing out that very few hospitals are able to meet them. Some jurisdictions are even declaring that CTAS level 4 and 5 patients should be treated in the community and in some cases mandating deferral from the ED to primary or urgent care centres. The CTAS NWG and NACRS receive a number of requests each year, for additions or changes to the CEDIS complaint list. In many cases articulating which current complaint is applicable is sufficient to satisfy these requests. For the remaining requests a group of Computer Emergency Department Information System (CEDIS) NWG and CTAS NWG members adjudicated them to reach a consensus.

Heat related issue was an addition previously made by 2 of our international partners, Japan and Saudi Arabia, and with global temperatures continuing to rise it was deemed important to add this to our Environmental complaints group. The OTAS working group engaged the CTAS NWG during their development recognizing the value of adopting our first order modifiers and definitions wherever our tools matched. This allowed us to review our pregnancy modifiers and educational components and determine the value of updating and aligning with OTAS in key common areas.

The CTAS NWG has long recognized the challenge that the elderly pose at triage based on a number of factors including knowledge of their premorbid condition, communication difficulties, factors influencing physiologic parameters and variable presentations of common conditions. As our aging population continues to grow and the medical system struggles to meet the demands, the emergency department often becomes the destination of choice to sort out a myriad of medical and non medical problems. To address concerns that certain groups of the patient population are more prone to deterioration with long waits to be seen, a frailty modifier has been developed to help identify these patients and to up-triage them to a CTAS level 3 to ensure they don't get missed. The frailty modifier and the new geriatric educational components have been developed in collaboration with the CAEP Geriatric Emergency Medicine Practice Committee. Paediatric updates are developed in collaboration with the Canadian Paediatric Society.

Several jurisdictions have been using CTAS in pre-hospital practice to support communication with their emergency department colleagues, with the province of

Ontario legislating its use in 2009. The recent addition of the Paramedic Chiefs of Canada in 2016 now allows for a 2-way dialogue with the CTAS NWG and the opportunity to ensure Prehospital CTAS has improved sensibility. With more and more educational initiatives developing online educational opportunities, it was recognized that for our CTAS Providers, especially in rural and remote locations, this is required. This manuscript will highlight all of the updates for CTAS 2016 and be accompanied by a second publication expanding on the Geriatric triage teachings, as well as another publication focusing on the present and future role of Pre-CTAS.

REVISIONS

1. CTAS time targets

While it has been suggested that the recommended triage response times be lengthened because few emergency departments will ever be able to meet them, the CTAS levels 1–5 acuity time targets will remain unchanged.

Rationale

While the 80–95% ‘fractile response time’ targets proposed in the 1999 CTAS Implementation Guidelines¹ are not achievable by busy EDs, the CTAS acuity time targets were developed to ensure appropriate patient prioritization. We would propose replacing fractile response rates with ‘benchmarking’ ED performance metrics in line with the CAEP position paper published in 2013.¹¹ The overall goal for triage to physician initial assessment is a median of 1 hour and 90th percentile of 3 hours. Within this framework access and throughput needs to be optimized to ensure CTAS level 1 patients are seen immediately and sick CTAS level 2 and 3 patients within as timely a manner as possible. This allows individual sites to compare year on year time targets and also the opportunity to contrast performance metrics with provincial and national EDs with similar resources and serving similar patient populations and learn from high performing institutions. What is important to understand is that the 5 CTAS acuity/risk levels and their respective modifiers have been developed to be highly sensitive but not specific.

An ‘immediate’ response to life or limb threatening presentations doesn’t need clarification, however, many CTAS level 2 or CTAS level 3 patients will not suffer

from delays in care beyond the 15 and 30 minute targets. The key is that within their respective cohorts selected patients do need timely care and the clinical experience of the triage nurse, and safe ED processes, will support those goals. Examples include performing an ECG on all “chest pain, cardiac features” and having a physician review within 15 minutes to avoid missing an ST elevation infarct and to also expedite those patients with ongoing pain. For stable patients with “extremity weakness / symptoms of CVA” within the therapeutic window, CTAS level 2, activating the stroke team or having a direct to CT scan protocol may shorten the door to needle time for eligible patients. High risk mechanism of injury patients may be stable on arrival but still triaged as CTAS level 2. They should not displace lower acuity patients in more distress but be placed in an internal waiting room or close line of site to be carefully observed for signs of deterioration while waiting for physician assessment (this is a high risk rather than high acuity patient). Many CTAS level 2 and CTAS level 3 patients present with moderate to severe pain conditions. In some cases these are signals of a life threatening condition but in all cases they should be afforded timely analgesia. With a heightened awareness of the dangers of delayed recognition and management of sepsis (3 SIRS criteria), CTAS level 2 and (2 SIRS criteria looks unwell) level 3, processes need to be in place to assess and prioritize post triage. Dislocations and displaced fractures are CTAS level 3. While delays may not lead to bad outcomes, reducing these injuries significantly improve comfort and satisfaction. CTAS level 4 and 5 patients are by definition stable, yet admission rates can be as high as 10% and 4% respectively, indicating many of them require careful workups.

2. CTAS as a diversion tool

As our population continues to grow and to age Emergency Department visits remain high and wait times continue to be an issue largely as a result of system overcrowding. All efforts to resolve this problem through improved ED efficiencies have failed because they cannot address the issues of timely access to care in the community and lack of inpatient and long-term-care spaces to support rapid outflow of patients from the ED.¹¹ Recently a number of administrators have sought to co-opt CTAS as a tool to identify ‘inappropriate ED visits’, with plans to divert them away

from the emergency department. In addition, retrospective reviews of discharged ED patients have attempted to define ‘primary care appropriate’ ED diagnoses and calculate the per cent of patients who are “misusing” the emergency departments.

Without a presentation specific deferral algorithm and methodologically sound research to support safety, efficacy, and patient satisfaction deferral policies away from the ED should be tempered, and CTAS should not be applied to make these decisions.

Rationale

- i) CTAS was developed to prioritize ED patients based on acuity and risk and was never designed to identify patients who were inappropriate.
- ii) The US Emergency Medical Treatment and Labor Act (EMTALA) in 1994 defined an emergency medical condition as “any medical or behavioural condition of recent onset and severity, including but not limited to severe pain, that would lead a *prudent layperson*, possessing an average knowledge of medicine and health, to believe that his or her condition, sickness or injury is of such a nature that failure to obtain immediate medical care could result in placing the patient’s health in serious jeopardy, cause serious impairment to bodily functions, serious dysfunction of any bodily organ or part, or in the case of a behavioral condition placing the health of such person or others in serious jeopardy”.
- iii) A number of studies have shown that non EMS patients have already tried different options to access care or have decided the ED is the best option for their problem.^{12,13}
- iv) Those studies looking at deferral or refusal of care for patients triaged as low acuity have noted this practice to be “measurably unsafe and will lead to inappropriate refusal of care for patients requiring hospital treatment”.¹⁴⁻¹⁶ Admission rates for CTAS level 4s vary from 3-10% and for CTAS level 5 from 1-4% both nationally and internationally.¹⁷
- v) A study looking at presenting complaint and discharge diagnosis to see if discharge diagnosis could be used to identify nonemergency visits found that while 6.3% of patients at discharge could have been treated in a primary care setting, the same presenting complaints were reported for 88% of all ED visits, indicating the need for a

careful medical assessment prior to consideration to defer.¹⁸

3. CEDIS Complaint updates

While the CTAS NWG and NACRS receive numerous requests for new CEDIS complaints or name changes, the goal is to limit these as much as possible to support the education and adoption of CTAS revisions.

Rationale

In many instances, understanding the reason for a CEDIS complaint change or addition, allows for a clear explanation as to which existing complaint should be selected and applied. There were, however, a few wording changes that made sense and 3 new complaints added based on work with the Obstetrical Triage Acuity Scale group, climate change, and the number of emergency departments who provide scheduled revisits for treatment (Table 1).

Two complaints changed category with *Cast check* moving from General and minor to Orthopedic and *Removal of staples/sutures* from General and minor to Skin. The NACRS CEDIS Presenting Complaint List (V5.0) contains these changes and can be accessed at <http://caep.ca/resources/ctas/cedis>.

4. Heat related issue

Rationale

As climate change continues to warm the atmosphere, with 2016 being the hottest year on record, heat related presentations to the emergency department will become more common. Both our Japanese and Saudi Arabian CTAS adopters had already identified this as a deficiency. Heat stroke is a life-threatening emergency and requires immediate cooling and resuscitation while patients with heat exhaustion can deteriorate if not appropriately evaluated and managed.^{19,20} See Table 2 for the relevant modifiers.

5. Obstetrical/Gynaecological revisions

Rationale

Over the last two years the National Obstetrical Triage Working Group built on the work of the London Health Sciences Centre group who developed the Obstetrical Triage Acuity Scale (OTAS). They

Table 1. New or Revised Adult Presenting Complaint

CEDIS Complaint Category	Previous Complaint	New or Revised Complaint
Cardiovascular	Bilateral leg swelling/edema	Leg swelling/edema
Environmental	No previous	Heat related issue
Obstetrical-Gynaecological	No previous	Post partum issue
Trauma	Major trauma – blunt	Multisystem trauma - blunt
	Major trauma – penetrating	Multisystem trauma - penetrating
General and Minor	No previous	Return visit for therapy
	Imaging test	Imaging test/blood test
	Abnormal lab values	Abnormal lab/imaging results

CEDIS = Canadian Emergency Department Information System.

Table 2. New Environmental Complaint and Modifiers

Presenting Complaint	Modifiers	CTAS Level(s)
Heat related issue		1-4
	Respiratory distress	1-3
	Hemodynamic status	1-3
	Level of consciousness	1-2
	Pain score (peripheral)	3-4
	Frailty	3
	Core temperature greater than 41°C	1
	Severe dehydration	1
	Core temperature 39° - 41° C	2
	Moderate dehydration	2
	Ongoing heat cramps	3
	Mild dehydration	3
	Heat cramps resolving, well hydrated	4

recognized that CTAS did include pregnancy issues, but felt this was inadequate for the needs of the delivery room. When contacting the CTAS NWG for advice, the former Co-Chair, joined their working group, which allowed for sharing and borrowing of knowledge. They adopted the CTAS vital sign modifiers while CTAS adopted and revised a number of the special modifiers.²¹ It was also realized that CTAS did not currently address post pregnancy presentations so *Post partum issues* was added (Table 3).

6. New Frailty modifier

Rationale

As volume and capacity pressures on emergency departments continue, certain groups are at risk for prolonged wait times who run a greater risk of deteriorating or suffering unduly. These include: the frail elderly, those

who are physically disabled, cognitively challenged, with debilitating diseases, or homeless, especially if unaccompanied.

Studies show increased ED wait times lead to delayed analgesia, delayed antibiotics, higher ICU admissions and increasing mortality rates for all patients with the elderly even more susceptible.²²⁻²⁶ Holding vulnerable patients, with dementia and/or multiple comorbidities in a waiting room, with the potential for dehydration, untreated pain, increasing fatigue and immobility, can lead to the precipitation of delirium.^{27,28}

The introduction of a CTAS level 3 ‘frailty modifier’ will allow triage nurses to up-triage such patients normally rated as a CTAS level 4 or 5.

Frailty modifier definition

Any patient completely dependent for personal care; who is wheelchair-bound; suffers from cognitive impairment that limits their awareness of their surroundings or ability to appreciate time; is in the late course of a terminal illness; is showing signs of cachexia and general weakness; or is over 80 years of age unless obviously physically and mentally robust.^{29,30}

7. Geriatric triage considerations

Rationale

The over 65 year old age group is our fastest growing population demographic as baby boomers reach retirement age and are expected to represent 20% of the population by 2030. There has been a parallel rise in ED visits by this group and they tend to be more complex, require more resource utilization and have higher admission rates.^{31,32}

Table 3. New Obs/Gyn Complaint and Revised Special Modifiers

Presenting Complaint	Previous Special Modifiers	Revised Special Modifiers	CTAS Level	
Pregnancy issues >20 weeks	presenting fetal parts, prolapsed cord vaginal bleeding 3rd trimester	presenting fetal parts or prolapsed cord	1	
		active vaginal bleeding	1	
	active labour (contractions less than or equal to 2 min)	actively seizing or postictal	1	
		penetrating abdominal trauma in pregnancy >20 weeks	1	
	no fetal movement / no fetal heart tones headache +/- edema +/- abdo pain +/-hypertension	no fetal movement	1	
		active labour (contractions less than or equal to 5 min)	2	
	post delivery active labour (contractions greater than 2 min)	unplanned / unattended birth	2	
		decreased fetal movement	2	
	Pregnancy issues <20 weeks	possible leaking amniotic fluid	headache +/- edema +/- epigastric pain +/-visual disturbance +/- CVA symptoms	2
			hypertension SBP greater than160 and DBP greater then 100	2
		heavy vaginal bleeding +/- pregnancy	major blunt trauma in pregnancy >20 weeks	2
			high risk substance abuse	2
		vaginal bleeding - normal VS vaginal bleeding - minor / spotting	active labour (contractions greater than 5 min)	3
			history of bleeding prior to presentation	3
		Postpartum issues*	hypertension SBP greater than140 and DBP greater than 90	3
			minor trauma - no direct abdominal trauma	3
			Vaginal fluid loss	3
pelvic pressure with abdominal cramping, back pain			2	
heavy vaginal bleeding	2			
cramping	3			
possible vaginal fluid leak	3			
mild to moderate vaginal bleeding	3			
spotting	4			
pink, mucous discharge	5			
Postpartum issues*	vaginal discharge	5		
	actively seizing or postictal	1		
	active vaginal bleeding with clots	2		
	headache +/- edema +/- epigastric pain +/-visual disturbance +/- CVA symptoms	2		
	hypertension SBP greater than160 and DBP greater than 100	2		
	chills, wound redness or purulent drainage	2		
	pelvic pain with abnormal vaginal discharge	2		
	unable to empty bladder/dysuria less than 72 hrs postpartum	2		
	high risk substance abuse	2		
	bright red bleeding/spotting less than 5 days postpartum	3		
	persistent headache post epidural anesthesia with delivery	3		
	mild/moderate headache +/- non dependant edema	3		
	hypertension SBP greater than 140 and DBP greater than 90	3		
wound redness/swelling +/- serosanguinous drainage	3			
bleeding/spotting + cramping greater than 10 days postpartum	4			

*New CEDIS presenting complaint so no previous special modifiers to compare to.

A number of factors lead to triage challenges among this population and may lead to under-triage placing some patients at increased risk. While there are many changes associated with aging and chronic disease, we have focused on 3 key areas:

- i) Homeostatic mechanism changes make vital sign interpretation more challenging.
 - a. *Respiratory*: Aging lungs have less elastic recoil, more dead space and decreased physiologic reserve.³³ A respiratory rate of greater than 27 breaths / minute is a sensitive predictor of adverse events and identifying critically ill patients.³⁴
 - b. *Hemodynamic*: Myocardial thickening, arterial wall stiffness, and hypertension lead to increased workload on the heart. Wider pulse pressures and a decreased response to circulating catecholamines can lead to orthostatic hypotension even without the influence of medications.³⁵ A systolic blood pressure of less than 110 mmHg often represents hypotension in the older population especially among trauma victims.³⁶ The resting heart rate also increases with age.³⁷
 - c. *Temperature*: Due to the combination of a less robust immune system, decreased cardiac output and decreased muscle mass older adults are often unable to mount a fever response.³⁸ For this reason subtle temperature changes, including hypothermia, may indicate a serious infection.³⁹
- ii) Several factors complicate pain assessment including changes in pain perception,⁴⁰ an increased risk of persistent pain,⁴¹ and difficulty in assessing patients with cognitive impairment.⁴²
- iii) Domains of care requiring special consideration include:
 - a. *Atypical presentations of common diseases*: Acute coronary syndromes are more likely to present without chest pain.⁴³ Sepsis often presents with apparently normal vital signs and non-specific symptoms.⁴⁴ Pneumonia patients are less likely to report respiratory difficulties, pain or febrile response with increasing age.⁴⁵ Patients with an acute surgical abdomen will often report only mild pain.⁴⁶
 - b. *Cognitive impairment*: Prospective ED studies of patients over the age of 65 and over 70 have reported rates of delirium of 9.6% and 10%

respectively.^{47,48} The second study also reported 16% had mental status impairment and 6% screened positive for both delirium and dementia.⁴⁸ Many of these patients with delirium went unrecognized by the treating physician and a number were discharged home. Early recognition of acute changes in cognitive behaviour by the triage nurse with communication to the rest of the care team is very valuable.

- c. *Falls and trauma*: ED trauma presentations among the elderly continue to rise along with morbidity and mortality, however, unlike their younger cohorts the major trauma mechanism is falls⁴⁹ often due to general weakness, impaired gait or vision, an acute medical event, medication, or balance issues.⁵⁰ The literature indicates the severity of the injuries, and the impact of comorbidities, among these patients are often underappreciated and as a result, undertriaged.⁵¹
- d. *Polypharmacy*: Reportedly 44% of US men and 57% of US women over the age of 65 are taking 5 or more medications per week making them susceptible to adverse drug events (ADEs).⁵² ADEs account for up to 10% of elderly ED presentations. Common drug categories causing ADEs include cardiovascular, diuretics, antibiotics, hypoglycemics, sedatives, opioid analgesics, anticholinergics and anti-inflammatory medications.⁵³

8. Paediatric updates

The fever modifier 'temperature greater than 38.5°C looks unwell' CTAS level 2 and 'temperature greater than 38.5°C looks well' CTAS level 3 will be limited to children 3–18 months, rather than the previous 3–36 months. Otherwise Paediatric CTAS remains unchanged.

Rationale

The fever modifier in paediatrics was adopted to capture the vulnerable population for sepsis in childhood. The fever modifier for newborns due to their relative immunodeficiency remains CTAS level 2. There has been a significant change in the incidence of serious infections in young children in relation to the greatly expanded immunization programs across the country. In recognition of the changing patterns of childhood infections, the temperature greater than

38.5°C fever modifier, which previously included children up to 36 months, will be limited to children 3–18 months. The fever modifier for newborns up to 3 months, due to their relative immunodeficiency, remains CTAS level 2.

9. Paramedic Chiefs of Canada

Paramedics across Canada have variably utilized CTAS since the 2004 revisions. Research looking at interrater reliability between EMS providers and ED triage nurses has shown good to moderate agreement.⁵⁴⁻⁵⁶ The appropriate application of Pre-CTAS can assist paramedics in clinical decision making and destination decision making. It can also provide an evidence-based rationale for system-wide pre-hospital resource allocation, when combined with dispatch information.

The addition of the Paramedic Chiefs of Canada (PCC) as the sixth member organization to join the CTAS NWG is an important step forward in ensuring the role and value of Pre-CTAS are fully developed. The PCC is an ideal partner as it is comprised of paramedic leaders from all the provinces and territories in Canada with a combined mission to “advance and align paramedic leadership” across the country.

Pre-CTAS is being formally used in Nova Scotia, Ontario, Manitoba, Alberta and Saskatchewan. It is also being applied less-formally in other jurisdictions. To better understand the extent and nature of Pre-CTAS use, the CTAS NWG has circulated an online survey to EMS managers and educators from every province and territory. The survey covered the areas of training, data collection, and details of operational and quality improvement usage.

A consistent educational and operational approach is required to maximize the potential benefits of Pre-CTAS across the country. The CTAS NWG in collaboration with the PCC is publishing a comprehensive overview and update of Pre-CTAS.

10. Planned CTAS education changes

Rationale

To date CTAS education has been provided as a one-day course led by one of more CTAS Instructors. This education has consisted of 4 teaching modules with the last 3 all containing approximately 20 cases which the students work through themselves or in groups while facilitated by the Instructor to ensure

everyone understand the principles and can select a relevant presenting complaint and assign an acuity score by applying an appropriate modifier(s). Both nationally and internationally there have been requests for an online educational option as well as a certification indicating a competence in CTAS knowledge, not just a certificate of attendance.

To support the current educational updates an online course is being developed to provide the didactic CTAS knowledge. The content will be a revision of the existing core materials but will also include several major additions. The first is the Geriatric learning section as referenced above. The second is a series of learning modules for each of the CEDIS presenting complaint groups. Both of these will contain sample cases to help clarify key points and each section will have several questions for the learner to complete before moving to the next section. After successful completion of the online component the final training will be a 3-4 hour face-to-face educational session with a CTAS Instructor either in a classroom setting or via distance technology (videoconference/webinar) for rural and remote triage nurses. Some key educational information will be provided or reviewed in these sessions, however, the focus will be in providing more complex cases to generate thoughts and discussion to determine how to most appropriately triage and prioritize each patient, recognizing that you are triaging each patient on their own merit, not the flow or other challenging situations occurring within the emergency department. Upon completion of the face-to-face session and final payment, the Provider or Instructor will receive a certificate of successful completion of CTAS training.

CONCLUSIONS

While the goal of emergency care providers is always to provide timely access to care, high patient volumes, frequent surges in ED arrivals and system capacity limitations, especially after hours, mean that waits are inevitable. To help provide patient safety and access equity CTAS was developed to assist triage personnel to prioritize patients based on acuity and risk, not to divert patients away. Based on national and international collaborations, 3 new CEDIS complaints have been added along with new modifiers. To better protect our more vulnerable patients a new CTAS level 3 frailty modifier has been introduced. To better address the triage challenges of older patients, new geriatric educational materials have been developed. Heightened

concerns for serious infections in young children have lessened with vaccinations decreasing the moderate risk age group to 3–18 months.

In addition, the focus has been on revising the educational materials and welcoming the addition of representation from the Paramedic Chiefs of Canada to the CTAS NWG. An online CTAS educational course is being developed to take much of the didactic teaching out of the classroom and focus that time on more challenging case-based discussion to ensure a clear understanding and comfort level applying the CTAS.
